## Presentation

The Computer Science, Data, and Applications program equips students with the skills to manage IT projects and carry out multidisciplinary and cross-functional assignments in a variety of sectors.

### Objectives

The objective of this specialization is to train computer engineers with knowledge in software design and development as well as systems, networks, and databases.

In addition to training in computer science and software engineering, the Computer Science, Data, and Applications specialization includes additional training in data science (from mathematics to the humanities and social sciences), enabling Computer Science, Data, and Applications engineers to acquire the skills necessary to evaluate and exploit big data in a responsible and transparent manner, taking security issues into account.

### International

100% of students go abroad

- either by completing a semester of training at a foreign university under inter-institutional agreements
- either by doing an internship abroad, in a company or in a laboratory, thanks to the School's network of partners

<https://www.polytech.univ-smb.fr/international/mobilite.html>

### The advantages of the program

The specificity of the Computer Science - Data - Applications engineer is their ability to leverage data through innovative applications in a wide variety of sectors (health, energy, transportation, construction, commerce, finance, banking, insurance, administration, culture, leisure), in industry or services, in a world undergoing digital transformation.

### Organization

### Expected enrollment

24 places for students

24 places for apprentices

## Study arrangements

The Disability Support Unit and the High-Level Sports (SHN) / High-Level Artist (AHN) program offer study accommodations.

 Find out more

## Admission

### Who is the program for?

- Integrated preparatory class
- CPGE students,
- Undergraduate students (L2, DUT, or equivalent)

 <http://www.polytech-reseau.org/postuler-a-polytech/cycle-ingenieur/>

## Apply and register

  Apply / Register

## And after

### Further studies at USMB

- Master's in Business Management and Administration
- Doctorate

### Targeted professions and professional integration

- Business intelligence consultant – Big Data;
- Data miner – Data scientist;
- E-business consultant;
- Information manager – Information and environmental data;
- Cloud and virtualization engineer;
- Urban planner – Functional architect functional system;
- Research and Development Engineer.

## Practical information

### Contact

Admission Polytech Annecy-Chambéry

## Presentation

### Description

This course prepares students for the TOEIC ("Test of English for International Communication") exam, specifically to obtain a minimum score of 785 points (out of 990).

With the aim of developing all four skills, this course also serves as an introduction to public speaking through presentations given by students in groups or individually on topics illustrated by press articles or video materials (VTD: Video, Talk and Debate, as well as written work). Depending on the location (Annecy or Chambéry), some will be seen at different times during the semester, the year, or even the three years of training.

Students are assessed throughout each semester. The final assessment consists of a 1-hour, 1.5-hour, or 2-hour exam, depending on the semester, and counts for 20% of the total continuous assessment.

### Objectives

**Specific objectives:** at the end of this course, students will be able to:

revise grammar on: the correct reflexes of common structures; the verb group and tenses (except the conditional tense); the noun group and all its constituent elements; logical links (connecting words)

improve their grammatical and lexical knowledge (general English and TOEIC-specific vocabulary) in class and independently, validating their progress through regular assessment tests.

## Mandatory prerequisites

CEFR level B1

---

## Course outline

### 1. Oral

1. Elements of phonology
2. Grammar (tenses, questions, adjectives.....)
3. Reinforcement of structures and vocabulary
4. Interactive oral communication
5. Introduction to and practice for the TOEIC (listening section)

### 2. Writing

1. Review of grammatical elements (tenses, questions, adjectives .....
2. Translation (theme/version)
3. Reading comprehension in authentic language
4. Curriculum vitae (in S5, S6, or S7 at the latest)
5. Cover letter/letter of motivation (in S5, S6, or S7 at the latest)
6. Introduction and training for the TOEIC (reading section)

## Presentation

### Description

This course focuses on physical and sports activities and is structured around two main areas.

On the other hand, the aim is to enable engineering students to acquire collective skills in project implementation and group management, but also to develop their individual abilities to adapt and regulate themselves. This focus will be reflected in the collective organization and implementation of a sporting event over the course of one session.

It also aims to enable students to acquire skills related to sporting activities and to highlight their interpersonal skills, which are essential for their integration and professional success. This focus will be based on the work carried out around the values conveyed by the various sporting activities and their diverse modes of practice.

### Objectives

**Objective 1:** Work as a team to prepare, organize, and manage a sporting event within a constrained framework.

**Objective 2:** Engage in a new physical activity in an intense, lucid, reasoned, and critical manner

## Presentation

### Description

Business games, also known as serious games or business management simulations, are educational tools that offer a different way of learning. They are simulations that aim to demonstrate the complexity of businesses while relying on a simplified model. In a business game, time is accelerated and participants play out several years in the life of a company over a condensed period (two days in this case). This business simulation is carried out using a computer program. The program incorporates an algorithm to calculate the performance of each competing team (each team representing a company in the market) at the end of each decision.

### Objectives

1. Analyze the general context to communicate more effectively.
2. Learn about the main communication tools, media/non-media,
3. Understand the process of developing a communication strategy,
4. Provide comprehensive, practical, and effective training in business management,
5. Raise awareness of the interdependence of business functions through decision-making and results analysis.

---

## Teaching hours

Tutorials	Tutorials	1.5
Distance	Distance learning	18

---

## Mandatory prerequisites

None

---

## Course outline

Focused on a cross-functional approach to business management issues, this game combines various constraints specific to different business functions (marketing, production, finance, and financial resources) and allows students to learn the basics of both oral and written communication. Through simulation, students will address person-to-person, face-to-face communication. External communication mainly involves communication for the purposes of corporate marketing: strategy development, overview of tools, etc.

---

## Targeted skills

- Be able to design the basics of a business strategy.
- Know how to support the development and implementation of a communication plan,
- Be able to work in a team,
- Know how to communicate and make decisions as part of a team

---

## Bibliography

## Presentation

### Description

As the school is committed to a skills-based approach, this course aims to introduce students to this approach, familiarize them with the skills framework for their training, and present them with the various documents and tools they will need to use throughout their training.

### Teaching hours

CM	Lecture	3
Tutorial	Tutorials	12

### Course outline

#### Content elements for all specializations

- Understanding the APC approach and its relevance to engineering education (link to professions, RNCP)
- Understanding the main concepts and learning the terminology used by the school
- Find resources related to APC (reference documents, RNCP files, cross-referenced matrices, AMS mapping, portfolio, etc.)

- Reading a training reference document (templates and examples)
- Understanding what a portfolio is
- Write a skills assessment (KAPC+ example)

**Specific content elements for each specialty**

- Get to grips with the reference framework for your specialty
- Link the reference guide to job characteristics
- Assessing your position in your training program
- Identify the contribution of resources to the skills in the reference framework (cross-referenced matrices)
- Identify the situational activities (AMS) in your training and the skills they involve
- Use the portfolio to self-assess the skills in your training program

## Optional internship S5 (PROJ500\_PACY)

Polytech Annecy-  
Chambéry  
component

### In brief

- **Languages of instruction:** French
- **Open to exchange students:** Yes
- 

## Overview

### Description

The optional internship aims to enrich students' academic and professional experience by offering them a practical opportunity to apply their knowledge and acquire new skills. An optional internship can be carried out in **France or abroad**. It must comply with the same general conditions as compulsory internships.

### Objectives

- **Acquisition of specific skills related to the specialization;**
- **Refining career goals and/or** gaining confidence and independence through the completion of a project or specific tasks;
- Establish valuable professional contacts that can help in future job searches.

## Presentation

### Description

This support is open to all students at the school: students, apprentices, and Continuing Education employees. It is not mandatory, as it is primarily intended for students who need it to succeed in their training. This semester, it is scheduled into the timetable for each course, with a total of 64 hours.

Support may take the form of refresher courses, upgrading courses, or support in the main areas of the training programs.

Peer tutoring is encouraged and the educational resources of the Polytech Network are used (↗ <https://eplanet.polytech-reseau.org/> ).

### Objectives

To promote the success of all students in their educational journey.

## Overview

### Description

This course trains engineering students in the issues surrounding sustainable development and its integration into businesses. The aim is to enable them to consider and integrate the challenges of ecological and energy transition into their professional work.

### Objectives

Students will learn to define the various challenges of ecological and societal transition, as well as energy issues. They will be introduced to the tools available to engineers to limit the ecological impact of a product or service.

### Teaching hours

Lectures	Lecture	15
Tutorial	Tutorials	12

### Course outline

1. Introduction to sustainable development (3 hours of lectures)

1. 1. Planetary boundaries
2. Concept of sustainable development and ecological and societal transition
2. Carbon footprint (3 hours of lectures)
  1. The concept of climate
  2. Climate change - Greenhouse gases
  3. Carbon footprint method (6 hours of tutorials)
3. Energy (3 hours of lectures)
  1. Concepts of power and energy
  2. Global energy situation
  3. Practical exercises and case studies (3 hours of tutorials)
4. The ecological transition in business (1.5 hours lecture)
5. Product life cycle analysis, eco-design (3 hours lecture, 3 hours tutorial)

## Overview

### Description

This is an introductory course on the use of programming to solve problems related to engineering. It will introduce concepts of algorithms and data representation in a computer. In practice, students will also learn to program in Python for the MM track and C for the IDU/SNI tracks.

### Objectives

This course aims to provide students with basic knowledge of how information is represented in computers, while also introducing them to traditional data structures. The module also aims to teach students the basics of algorithms and programming. The goal is to enable students to use IT tools to solve problems encountered in engineering.

---

## Teaching hours

Lectures	Lecture	3

## Course outline

The course is divided into:

- Lectures (CMs), where concepts related to algorithms and data structures will be introduced
- Tutorials (TDs), where concrete examples will be put into practice in a programming language
- Practical work (PW) where we will explore concepts and skills in depth to solve concrete problems. The program is as follows:
  1. Machine architecture and basic data representations
  2. Algorithmic concepts and introduction to C programming
    1. Language basics
    2. Control structures
    3. Loops
    4. Functions and procedures
    5. Compilation
  3. Data structures and implementation in C language
    1. Structs
    2. Linked lists
    3. Graphs and trees
  4. Complex algorithms
    1. Sorting and selection
    2. Graph traversal
    3. Hashing
  5. Concept of algorithmic complexity
  6. Use of a high-level language: the case of Python

In MM courses:

1. Machine architecture, data representation
2. Introduction to Python programming
  1. The basics of the language
  2. Basics of the language
  3. Control structures

---

- 4. Loops
- 5. Functions and procedures
- 6. Classic data structures
- 3. Algorithmic concepts and implementation in Python
  - 1. Calculation of mathematical functions
  - 2. Sorting and selection
- 4. Object-oriented programming
- 5. Problem solving using libraries

---

## Targeted skills

At the end of this module, students should be able to:

- model a concrete problem using an appropriate data structure
- solve the problem by implementing an algorithmic approach
- program the solution on a computer

---

## Bibliography

- Learning to Program with Python 3.  Gérard Swinnen

## Overview

### Description

This course aims to provide students with the basic skills needed to model, implement, and manipulate a relational database. The course focuses on general and business-related problems.

### Objectives

1. Designing a simple relational database (< 10 entities, linked only by 1-n or n-m relationships)
2. Implementation of a simple DB in a relational DBMS
3. Use of a relational DB through simple queries

### Teaching hours

Lectures	Lecture	6

## Presentation

### Description

This module is an introduction to project management in general and IT project management in particular. Students will become familiar with the various factors to be taken into account, the different stages (scoping, planning, monitoring, software life cycle), and the practices and tools used to develop small software systems.

### Objectives

The objective of the course is to enable students to implement a small-scale IT project management method using various tools: planning, collaboration, version management, etc.

Students will be required to use these methods and tools in various projects throughout their training.

### Teaching hours

Lectures	Lectures	6
TD	Tutorials	6
Lab	Practical work	28

---

## Mandatory prerequisites

INFO501\_PACY INFO502\_PACY

## Course outline

---

Lecture 1: What is software and how is it developed?

- What is software?
- Software life cycle
- The software development crisis
- Waterfall approach
- Limitations of the waterfall approach

Lesson 2: Other approaches to development

- Spiral
- Iterative
- Agile

Lesson 3: Project planning

- PERT/GANTT
- SWOT
- Risk Management

Lesson 4: Software Development Tools

- Open Source Approach
- Collaborative tools (communication, version management, etc.)
- Continuous Integration
- Error and Requirements Management

All tutorials will focus on the concepts covered in lectures, namely defining the project in terms of duration and resources, planning, and SWOT analysis.

The first two practical sessions will focus on implementing the various methods and tools. The other practical sessions will be dedicated to a team IT development project. Students will be required to manage the project (using PERT and GANTT), define the necessary resources, and then carry out the development work, taking into account any errors and the client's requirements.

## Overview

### Description

This course aims to enable engineering students to think about and study digital transformation in a sociological context. We will approach "digital" both as a subject of study and as an instrument of sociological change. First, we will provide an introduction to sociology. Next, we will analyze the anthropological and sociological foundations of digital technology. Next, we will analyze how digital technology has transformed ways of being and social practices (interacting, mobilizing, informing oneself, working, engaging in cultural practices, etc.).

The course will continue with case studies of technical and social issues.

### Objectives

The aim of the course is to raise awareness among future engineers of the social dimensions of the digital revolution. This course will also lay the foundations for digital ethics, which is a fundamental skill to be acquired by the end of the program.

---

## Teaching hours

Lectures	Lecture	13.5
Tutorial	Tutorials	22.5
Lab	Practical work	4

---

## Mandatory prerequisites

None

---

## Course outline

- Introduction to sociology
- Conceptual foundations of digital technology
- History of the evolution of information technology
- Connected societies
- Introduction to social networks
- Digital technology and politics
- Identity issues
- Case studies

---

## Targeted skills

Extracting the social dimensions of a digital product

- Repositioning digital technology in the context of human evolution
- Develop digital products that take social dimensions into account
- Extract the ethical and human dimensions of IT projects

## Presentation

### Description

This course aims to provide students with knowledge of graph theory and its applications so that they can use this computational tool to model and manipulate data representation problems. Drawing on graph theory, this course also aims to provide students with knowledge of language theory so that they can design a language for a target application.

### Objectives

By the end of the course, students will be able to:

- choose a generic, N-ary tree structure suited to a given problem,
- design and implement iterative and recursive algorithms dedicated to N-ary trees,
- design and implement iterative and recursive algorithms dedicated to generic trees,
- choose a graph structure suited to a given problem,
- implement classic algorithms dedicated to graph traversal,
- design and implement a rational language,
- design and implement a language based on a lexicon and grammar.

## Teaching hours

Lectures	Lecture	12
Tutorial	Tutorials	12
Lab	Practical Work	4 p.m.

---

## Mandatory prerequisites

INFO501 (Basics of Python Programming)

---

## Course outline

1. Trees and tree structures
  1. Data structures (sequential and recursive)
  2. Tree primitives
  3. Tree traversal algorithms (depth/width, prefix/infix/postfix, etc.)
  4. Binary trees (search trees, red/black trees, etc.)
2. Graphs
  1. Data structures (matrix and set-based)
  2. Primitives on graphs
  3. Graph traversal algorithms (shortest path, spanning tree, flows, etc.)
    3. Language theory
  1. Rational languages
  2. Finite state machines
  3. Lexicon and grammar

Lab 1 Data sorting: Binary search tree (BST)

TP2 Task scheduling: Directed acyclic graphs (DAG)

TP3 Traveling salesman

TP4 Speaking Idul (IDU language): Language design

## C Programming (INFO503\_PACY)

Polytech Annecy-  
Chambéry  
component

## Overview

### Description

This C programming course, designed as a follow-up to the Python course, aims to deepen understanding of low-level machine mechanisms (binary representation and memory management), master the syntax and semantics of the C language, manage dynamic allocation, implement fundamental data structures (linked lists), and develop efficient sorting and search algorithms. It consists of 6 hours of lectures, 6 hours of tutorials, and 12 hours of practical work.

### Objectives

By the end of this course, students should be able to:

- **Understand** the binary representation of data and its organization in memory.
- **Master** the basic syntax of the C language: types, operators, control structures, and input/output management.
- **Use** pointers to manipulate addresses and perform pointer arithmetic.
- **Implement** dynamic memory allocation with malloc, calloc, realloc, and free, and detect memory leaks.
- **Implement** and manipulate fundamental data structures, in particular simple linked lists.
- **Design**, code, and analyze the complexity of sorting algorithms (e.g., bubble sort, insertion sort, quick sort) and search algorithms (linear and binary).

## Languages and Paradigms (INFO531\_IDU)

Polytech Annecy-  
Chambéry  
Component

### In brief

- **Languages of instruction:** French
- **Open to exchange students:** Yes
- 

## Overview

### Description

This course offers an introduction to language theory and explores the main paradigms that structure programming languages. Students will discover the fundamentals of syntax, semantics, and program execution mechanisms, while comparing imperative, functional, object-oriented, logical, and concurrent paradigms. The objective is to provide the keys to understanding necessary to analyze, compare, and choose the languages best suited to different development contexts. Practical applications will illustrate the concepts through concrete examples and programming exercises.

### Objectives

Understand the theoretical foundations of programming languages.

Identify the essential characteristics of a language: syntax, semantics, and execution models.

Discover and compare the main programming paradigms (imperative, functional, object-oriented, logical, concurrent, etc.). Analyze the advantages and limitations of different paradigms depending on the context of use.

Develop the ability to choose a paradigm and language suited to a given problem. Put the concepts studied into practice through programming exercises.

## Teaching hours

Lectures	Lecture	10.5
Tutorial	Tutorials	9
Lab	Practical work	4 p.m.

## Mandatory prerequisites

None

## Course outline

### 1. General introduction

1. Why study languages and paradigms
2. History of programming languages

### 2. Language theory

1. Syntax and formal grammars
2. Semantics: static and dynamic
3. Compilation vs. interpretation

### 3. Imperative paradigm

1. Fundamental concepts: states, instructions, flow control
2. Examples: C, Python (imperative mode)

### 4. Functional paradigm

1. Pure functions, immutability, recursion
2. Examples: Haskell, Scala, OCaml

### 5. Object-oriented paradigm

1. Encapsulation, inheritance, polymorphism
2. Examples: Java, Python (OO mode)

### 6. Logical paradigm

1. Declarative programming, resolution by inference
2. Example: Prolog

### 7. Concurrent and parallel paradigm

1. Threads, processes, synchronization
2. Examples: Java Concurrency, Erlang

### 8. Comparison and selection of paradigms

1. Criteria for choosing a paradigm according to the problem
2. Hybridization of paradigms in modern languages

### 9. Practical applications

1. Case studies
2. Exercises in implementation in several paradigms

## Overview

### Description

The "worker" professional experience allows students to discover the practical aspects of blue-collar work and to understand the hierarchies, methods, and techniques used in companies. This experience should preferably take place in an industrial or construction company related to the student's area of expertise and likely to hire engineers. Teleworking is not permitted.

### Objectives

- Gain experience in a professional environment as an operator (worker, unskilled person, etc.);
- Integrate into and participate in a professional organization;
- Observe how the company operates;
- Identify the roles of employees (engineers, technicians, workers, etc.);
- Analyze working conditions, risks, and work organization;
- Reflect on sustainable development and social/environmental responsibility;
- Draw conclusions from the internship for your own training, career plans, and management methods.

## Overview

### Description

This course aims to familiarize students with the fundamental principles of financial management and corporate finance. It is structured in such a way as to facilitate understanding of the interactions between key concepts, practical tools, and key players, with a view to rapid and effective application in a professional context.

### Objectives

- Understand the key concepts of entrepreneurship and business start-up/takeover.
- Acquire the skills necessary to develop a business strategy.
- Explore financing and growth strategies for businesses.
- Develop an understanding of the challenges and opportunities faced by entrepreneurs.

### Teaching hours

Lectures	Lecture	10.5
Tutorial	Tutorials	9

---

## Mandatory prerequisites

None

---

## Course outline

The main topics covered are:

- The fundamentals of financial accounting
- Interpretation of financial statements (income statement, statement of changes in equity, balance sheet, cash flow statement, etc.)
- Sources of short- and long-term financing, both on and off balance sheet, as well as stakeholders, financial structures, etc.
- Key players in the financing process (banks, venture capital/private equity, etc.)
- Aspects related to valuation and exit scenarios
- The correlation between strategy and financial control, as well as the role of the business plan
- Cost and revenue analysis techniques
- Designing a performance management system (indicators, dashboard, financial and non-financial criteria, etc.)

---

## Targeted skills

- Understanding key points in a company's financial statements, knowing how to look at a balance sheet from a financing perspective, analyzing a company's situation
- Knowing how to build an economic performance management system.
- Understanding the different sources of financing and their impact on capital structure.
- Ability to identify and manage financial risks in a technological context.

---

## Presentation

### Description

This introductory course in law aims to familiarize students with fundamental legal concepts. It explores the basic principles of law, with an emphasis on legal aspects related to the practice of engineering, such as contracts, civil liability, intellectual property, and industrial regulations.

### Objectives

- Understand the general principles of law
- Acquire the knowledge necessary to interpret and draft contracts related to engineering projects.
- Explore the concepts of civil liability and intellectual property protection in the context of technology projects.
- Develop legal and ethical awareness in engineering practice.

## Issues in Artificial Intelligence (DATA601\_PACY)

Polytech Annecy-  
Chambéry  
component

### Presentation

#### Description

In the era of large language models, it is no longer enough to know how to use a chatbot: it is crucial to understand the underlying mechanisms in order to discern where AI brings real value and where it reaches its limits. As future engineers and citizens, engineering students will be called upon to observe the profound impact of these technologies on society—transforming professions, redefining social interactions, and disrupting decision-making processes. At the same time, the massive emergence of AI-dedicated computing centers raises major environmental issues: the energy consumption and carbon footprint of model training continue to grow and call for responsible technical and organizational choices. Finally, behind every AI application lie ethical challenges: copyright protection, privacy, and prevention of malicious use are all issues that require critical and informed consideration.

#### Objectives

By the end of the module, students will be able to:

- Describe the basic functioning of a neural network (perceptron, backpropagation) and explain the role of attention in a transformer.
- Explain what a language model is and give concrete examples of applications.
- Identify at least three types of bias in LLMs and propose a simple method for detecting them.
- Estimate the energy impact of an LLM model and list two best practices for reducing it (choice of infrastructure, work splitting).
- Write and test a clear prompt to generate useful text (summary, code, explanations).
- Recognize copyright and privacy issues related to the use of an LLM.

## Business-oriented project management techniques (PROJ602\_PACY)

Polytech Annecy-  
Chambéry  
component

## Presentation

### Description

Project management requires methods and techniques that all engineers must know. However, depending on the profession, the stages and tools used to manage a project may differ. This course is differentiated according to the program.

With the help of the Corporate Relations Department and the Business Club, stakeholders from the socio-economic world come to present their daily experiences and how they evolve in project mode to control objectives, deadlines, costs, and associated resources.

### Objectives

Acquire a project management methodology

Understand the necessary relationships between all project stakeholders Master the stages and tools of project management

## Presentation

### Description

This course prepares students for the TOEIC test ("Test of English for International Communication") and, more specifically, for obtaining a minimum score of 785 points (out of 990).

Students are assessed throughout each semester. The final assessment consists of a 1-hour, 1.5-hour, or 2-hour exam, depending on the semester, and counts for 20% of the total continuous assessment.

### Objectives

**Specific objectives:** by the end of this course, students will be able to:

review grammar on: correct reflexes for common structures; verb groups and tenses (except for the conditional tense); noun groups and all their constituent elements; logical links (connecting words)

improve their grammatical and lexical knowledge (general English and TOEIC-specific vocabulary) in class and independently, validating their progress through regular assessment tests

## Optional internship S6 (PROJ600\_PACY)

Polytech Annecy-  
Chambéry  
component

### In brief

- **Languages of instruction:** French
- **Open to exchange students:** Yes
- 

## Overview

### Description

The optional internship aims to enrich students' academic and professional experience by offering them a practical opportunity to apply their knowledge and acquire new skills. An optional internship can be carried out in **France or abroad**. It must comply with the same general conditions as compulsory internships.

### Objectives

- **Acquisition of specific skills related to the specialization;**
- **Refining career goals and/or** gaining confidence and independence through the completion of a project or specific tasks;
- Establish valuable professional contacts that can help in future job searches.

## Presentation

### Description

This support is open to all students at the school: students, apprentices, and Continuing Education employees. It is not mandatory, as it is primarily intended for students who need it to succeed in their training. This semester, it is scheduled into the timetable for each course, with a total of 32 hours.

Support may take the form of refresher courses, upgrading courses, or support in the main areas of the training programs.

Peer tutoring is encouraged and the educational resources of the Polytech Network are used (↗ <https://eplanet.polytech-reseau.org/> ).

### Objectives

To promote the success of all students in their educational journey.

## Overview

### Description

This course aims to provide students with the skills to model a problem according to a logical description and implement it in a logical language such as Prolog.

### Objectives

By the end of the course, students will be able to:

- describe a problem in the form of first-order propositional and predicate logic
- implement a problem described in first-order predicate logic in a programming language
- infer knowledge from logical programming.

---

## Teaching hours

Lectures	Lecture	10.5
Tutorial	Tutorials	10.5
Lab	Practical work	20

---

## Mandatory prerequisites

MATH 531 (section: Graphs)

---

## Course outline

1. Propositional logic
  1. Language and semantics
  2. Deductive aspects
  3. Normal forms
2. First-order predicate logic
  1. Quantifiers and Variables
  2. Models and Proofs
  3. Normalization, Unification, and Resolution
3. Logic Programming
  1. ProLog
  2. From Logic to Prolog
    - TP1 Family Trees
    - TP2 Finite State Machines
    - TP3 Puzzle - Logigram
    - TP4 Rule-based systems
    - TP5 TP exam

## Presentation

### Description

This module applies the data structures and algorithms presented in the "Graphs and Languages" module. It takes the form of software development in accordance with the IT project management methods covered in the "Project Management" module. In particular, tools appropriate for modular program development and code evolution management will be used.

### Objectives

By the end of the course, students will be able to:

- identify existing algorithms that can address a given problem or contribute to its resolution,
- explain precisely the chosen algorithms, how they work, and how they are orchestrated,
- implement the chosen algorithmic solution,
- define and apply a testing procedure for the program created,
- measure the performance of the program developed.

## Probability and Statistics (MATH631\_IDU)

Polytech Annecy-  
Chambéry  
Component

## Presentation

### Description

This course covers the main concepts of probability and statistics useful in engineering sciences in order to know how to use them to model concrete situations.

### Objectives

By the end of this course, students will be able to:

manipulate discrete or continuous variables, understand and use classical laws, find the law of a random variable and a sum of random variables.

### Teaching hours

Lectures	Lecture	18
Tutorial	Tutorials	6 p.m

### Mandatory prerequisites

Numerical series, generalized integrals.

### Course outline

#### 1. Probability

1. Definitions, enumeration, probability laws, conditional probability, and independence.

- 2. Discrete random variables and common discrete probability distributions
- 3. Continuous random variables and main continuous laws
- 4. Pairs of random variables
- 5. Joint and marginal laws
- 6. Convergence of sequences of random variables
- 7. Approximations by classical distributions

2. Statistics

- 1. Descriptive statistics
- 2. Double statistical series, different types of regression.

## Overview

### Description

This module is an introduction to the object-oriented approach. It covers aspects related to design and programming. For the programming part, Java is used as the support language.

### Objectives

By the end of this module, students will be able to explain the characteristics of the object-oriented approach. In particular, they will be able to explain the structure of an object-oriented application, how objects communicate, what encapsulation is and its benefits, what inheritance is and its link to code reuse, as well as explain polymorphism, its link to inheritance, abstract classes, and interfaces.

Students will be able to design and implement a relatively small object-oriented application (10 classes) based on a problem description. In particular, they will be able to define a class diagram based on a problem description, create class instances and make them communicate, and build an application involving inheritance, abstract classes, and interfaces, set up an event-based communication mechanism, and build a graphical interface containing several windows that exchange events.

Students will also be able to explain the role of design and programming in the software life cycle.

---

## Teaching hours

Lectures	Lecture	9
TD	Tutorials	9 p.m.
Lab	Practical Work	8

## Overview

### Description

This course focuses on learning how to develop web applications as an interface for data manipulation. This type of application, built on a three-tier architecture, includes a relational database, a web server for the backend that also provides the link to the database, and a user interface (web pages) for the frontend. The course covers these three dimensions. For the database part, it will involve implementing functions, procedures, and triggers in SQL programming language in order to perform initial processing on the database data. The web server is responsible for producing the web pages requested by the client and managing the transfer of data between the client and the database. Finally, the client part is an ergonomic, responsive design web interface, created in HTML/CSS/JavaScript with the support of a simple framework.

### Objectives

The objective of this course is to teach web technologies in the context of data manipulation between a relational database and a web client (web browser). Learners will work on implementing features in the three dimensions of this type of application: on the database server, the web server, and the client. Some concepts related to the encryption of sensitive data and environmental efficiency will also be covered.

---

## Teaching hours

Tutorials	Tutorials	13.5
AUTO	Independent study	6
PROJ	Project	12
PTUT	Supervised project	4

---

## Mandatory prerequisites

A good knowledge of the basics of programming (including object-oriented programming). Relational databases.

The principles of computer networks (such as the internet) and the client-server approach. Knowledge of how to build a web page using HTML and CSS.

---

## Course outline

Part 1: Review of data modeling for manipulation in a database (entity-association model, relational model), followed by an introduction to SQL functions, procedures, and cursors.

Part 2: Manipulating data from a simple web page (HTML, CSS) using a web server. The focus is on the backend of the application, establishing the link between the client application and the database. At the database level, use of triggers.

Part 3: Building a client-side frontend based on a simple JavaScript framework (interaction with the DOM, WebSocket, various APIs).

Part 4: Integration of knowledge through a mini website development project involving data manipulation. This part is carried out in project mode and involves teamwork and the use of collaborative development tools (project management, code versioning).

---

## Targeted skills

By the end of this course, learners will be able to:

- design and implement a medium-sized three-tier application,
- develop advanced features for data manipulation on a database server,
- develop a web application consisting of a server part (backend) and a client part (frontend), allowing data manipulation (database storage, display, simple processing, etc.).

- Master the main languages used in web development (SQL, HTML, CSS, JavaScript) and base development on existing frameworks or APIs.

## Overview

### Description

This course aims to provide an understanding of operating systems and virtualization from a user perspective. The course covers the main principles, and tutorials and practical work allow students to observe the system's responses and gain a better understanding of how it works.

### Objectives

- Understand the basic functioning of operating systems and virtualization;
- Understand resource sharing (processor, memory, files) by processes;
- Identify consistency issues and understand and implement synchronization mechanisms;
- Know how to use virtualization systems.

## Teaching hours

Lectures	Lecture	10.5
Tutorial	Tutorials	13.5
Lab	Practical work	16

## Mandatory prerequisites

None. Basic knowledge of C and Shell is a plus.

## Course outline

1. Introduction
  1. Role of systems, benefits of virtualization
  2. History
  3. Architecture
  4. Basic concepts
2. File management
  1. Tree structure
  2. File structures
  3. Manipulation
3. Process
  1. Concept of processes
  2. Processor sharing
  3. Communications
4. Synchronization
  1. Introduction to multitasking programming
  2. Consistency and synchronization
5. Virtualization
  1. Benefits of Virtualization
  2. Different types of virtualization and how they work

## Overview

### Description

Digital platforms now play a central role in the global economy, profoundly transforming business models, modes of communication, and consumer behavior. Their importance lies in their ability to connect millions of users, facilitate the exchange of goods, services, and information, and generate vast volumes of usable data. These platforms rely on the effect of software APIs that enable access to their services. They rely on agile business models, often based on network effects, where value increases with the number of users. Thus, digital platforms are not only technological tools, but major strategic levers in the digital transformation of businesses and societies.

### Objectives

The aim of this course is to introduce the principles and use of digital platforms and their strategy. In particular, the concepts of APIs will be introduced. We will focus on social networks (Facebook and Twitter), collaborative development platforms such as GitHub and Freshmat, and crowdfunding. Finally, an introduction to free software and participatory development will be given. This course will provide students with the opportunity to carry out a project based on these platforms.

## Presentation

### Description

This first project in the field of data science aims to analyze what data is needed to address a given problem, acquire it, ensure its consistency, and fill in any missing information. The data may be either structured data, as found in Open Data approaches, or unstructured data such as text (social media reviews: recipes, restaurants, etc.). The project will result in the creation of a document that will provide the models for the application, as well as the database schemas and data needed to address the problem.

### Objectives

By the end of this course, students will be able to:

- acquire more or less well-structured data,
- clean data,
- compensate for missing information in the data.

## Presentation

### Description

How can creativity and innovation be leveraged to enhance an organization? How can radical innovation be initiated based on the latest technological advances? This requires a thorough understanding of the innovation process and the ability to manage an innovative project in a complex and uncertain environment. It also involves adopting an entrepreneurial or intrapreneurial approach to mobilize and motivate interdisciplinary teams to achieve innovation. This training module offers the opportunity to acquire the methodologies and attitudes necessary to achieve these objectives.

### Objectives

- Structure, organize, and manage a highly exploratory process with a consistent approach
- Find resources or make do with available resources
- Adapting in real time to changes in context and constraints
- Manage the challenges of each phase of the project
- Act as a leader in uncertain environments
- Mobilize stakeholders

- Master new technologies

---

## Teaching hours

Tutorials	Tutorials	25.5
-----------	-----------	------

---

## Mandatory prerequisites

None

---

## Course outline

Part 1: Innovation management: theoretical foundations

Part 2: Creativity - Design thinking approach (different creativity tools depending on the stages of the process). Part 3: Role-playing

---

## Targeted skills

---

- Recognize and seize internal and external development opportunities
- Develop and formalize opportunities to transform them into innovative projects
- Know how to lead a design thinking-type creativity process
- Develop management and leadership skills for innovative projects: challenge preconceived ideas, mobilize stakeholders, lead with flexibility, and seize opportunities with agility

## Presentation

### Description

This course prepares students for the TOEIC (Test of English for International Communication) exam, specifically to obtain a minimum score of 785 points (out of 990).

With the aim of developing all four skills, this course also serves as an introduction to public speaking through presentations given by students in groups or individually on topics illustrated by press articles or video materials (VTD: Video, Talk and Debate, as well as written work). Depending on the location (Annecy or Chambéry), some will be seen at different times during the semester, the year, or even the three years of training.

Students are assessed throughout each semester. The final assessment consists of a 1-hour, 1.5-hour, or 2-hour exam.

### Objectives

**Specific objectives: at the end of this course, students will be able to:**

work on telephone conversations (comprehension/production)

listen regularly to news on English-language news sites (CNN, BBC, Sky News, etc.) and be able to succinctly summarize the main points orally, interacting with the class

work on a variety of audio and video materials and speak spontaneously in an interactive manner with the class

speak in a prepared manner and spontaneously interact through individual presentations (self-presentation and/or article reports, such as "quizzes") and presentations in pairs (various topics)

practice TOEIC exercises (4 parts of listening comprehension) + entire tests

---

## Presentation

### Description

This course is a training course in professional English. Students will work on their fluency in the five language skills by enriching their technical and professional vocabulary, through role-playing, cultural contributions, and written exercises (different topics from 602).

Activities will be carried out individually, in pairs, and/or in groups. Students will be assessed throughout the semester.

### Objectives

The objective is to improve students' autonomy in the English-speaking workplace in an international context.

### Teaching hours

Tutorials

Tutorials

---

## Mandatory prerequisites

Minimum TOEIC score of 785 – Semester 601 and/or 602 completed

---

## Course outline

Various presentations by professionals, mainly English-speaking teachers or external speakers.

---

## Targeted skills

Communicate independently, both orally and in writing, in all situations in a professional setting.

---

## Bibliography

A variety of authentic materials provided by the speakers and/or students themselves.

---

## Skills acquired

Polytech Annecy-  
Chambéry  
component

### In brief

**Languages of instruction:** French  
➤ **Open to exchange students:** Yes  
➤

## Overview

### Description

The optional internship aims to enrich students' academic and professional experience by offering them a practical opportunity to apply their knowledge and acquire new skills. An optional internship can be carried out in **France or abroad**. It must comply with the same general conditions as compulsory internships.

### Objectives

- **Acquisition of specific skills related to the specialization;**
- **Refining career goals and/or** gaining confidence and independence through the completion of a project or specific tasks;
- Establish valuable professional contacts that can help in future job searches.

## Presentation

### Description

This support is open to all students at the school: students, apprentices, and Continuing Education employees. It is not mandatory, as it is primarily intended for students who need it to succeed in their training. This semester, it is scheduled into the timetable for each course, with a total of 16 hours.

Support may take the form of refresher courses, upgrading courses, or support in the main areas of the training programs.

Peer tutoring is encouraged and the educational resources of the Polytech Network are used (↗ <https://eplanet.polytech-reseau.org/> ).

### Objectives

To promote the success of all students in their educational journey.

## Overview

### Description

The objective of the module is an in-depth study of stochastic modeling in the context of describing, analyzing, and searching for information in data. The main models studied are associated with probabilistic and statistical approaches. The module includes the study of single and multivariate probability families equipped with entropy functions, autoregressive and moving average families (as well as their neural generalizations), differential and stochastic integral families (of integer and fractional orders), Poisson processes and the Markovian properties of certain processes, as well as process interactions and mixtures of simple models.

### Objectives

Learning outcome 1: describe an imprecise observation using a stochastic model / Objective 1: select and validate the relevance of a stochastic model for describing a given observation or information hidden in a data stream.

Acquired knowledge 2: associate imprecise information with a parameter of the stochastic model / Objective 2: estimate the model parameters and highlight trends, changes, or deviations in process observations, compared with expected specifications

Acquired knowledge 3: tracking/predicting the evolution of a physical phenomenon or information / Objective 3: predicting the nature of future observations, taking into account the validated model and past observations

---

## Teaching hours

Lectures	Lecture	12
Lab	Practical work	24

---

## Mandatory prerequisites

Probability and Statistics

---

## Course outline

1. Mono- and multivariate probabilistic models
2. Cross-parametric and relative entropies
3. Maximum likelihood principle
4. Autoregressive statistical models and their neural generalizations
5. Stochastic integral equations / integer difference equations
6. Stochastic integral equations / fractional difference equations
7. Interacting processes and mixture models
8. Poisson processes - Markov chains and fields
9. Stochastic simulation and parameter estimation (random number generators, Monte Carlo methods, regressions, Bayesian approaches, etc.)

---

## Overview

### Description

This course provides an introduction to the principles and practice of computer network and system security. Topics covered will include cryptography, network and operating system security, worm and virus propagation mechanisms, and security incident management. We will also cover topics related to mobile application security, payment systems, and data security.

### Objectives

This course aims to provide students with the theoretical and practical knowledge necessary to protect information systems against digital threats. The main objectives are as follows:

1. **Understand the fundamentals of cybersecurity:** concepts of confidentiality, integrity, availability, authentication, and non-repudiation.
2. **Identify types of threats and attacks:** viruses, ransomware, phishing, denial-of-service (DDoS) attacks, social engineering, etc.
3. **Master protection tools and techniques:** firewalls, antivirus software, intrusion detection systems (IDS), encryption, identity and access management (IAM).
4. **Learn how to design secure architectures:** apply best practices to strengthen the security of networks, applications, and databases.

---

- 5. **Understanding legal and ethical issues:** regulatory compliance (GDPR, NIS2, etc.), digital responsibility, privacy.
- 6. **Developing analytical and response capabilities:** analyzing a security incident, creating an incident response plan, implementing a business continuity plan.
- 7. **Raise awareness of security in the software development cycle (DevSecOps):** integrate security from the design phase onwards.

---

## Teaching hours

Lectures	Lecture	13.5
Tutorial	Tutorials	22.5
Lab	Practical work	4

---

## Course outline

Introduction to security cryptography  
Symmetric cryptography Asymmetric cryptography Hash functions Key management and PKI  
Network security - Attacks Web security  
IPSec VPN and firewalls Intrusion detection User authentication Program security Malicious software

---

## Targeted skills

- Master the fundamentals of IT security:** cryptography, secure protocols, authentication, access control.
- Configure and secure network infrastructures:** firewalls, VPNs, intrusion detection/prevention systems (IDS/IPS).
- Analyze and detect vulnerabilities:** perform security audits, penetration tests (pentests), and vulnerability analysis.
- Develop and integrate secure applications:** apply secure development principles (DevSecOps).
- Implement security policies:** identity and access management (IAM), network segmentation, data encryption.

## Presentation

### Description

This course covers the main concepts of probability and statistics useful in engineering sciences in order to know how to use them to model concrete situations.

### Objectives

By the end of this course, students will be able to:

manipulate discrete or continuous variables, understand and use classical laws, and find the law of a random variable and a sum of random variables.

### Teaching hours

Lectures	Lecture	18
Tutorial	Tutorials	6 p.m

---

## Mandatory prerequisites

Numerical series, generalized integrals.

---

## Course outline

### 1. Probability

1. Definitions, enumeration, probability laws, conditional probability, and independence.
2. Discrete random variables and common discrete probability distributions
3. Continuous random variables and main continuous distributions
4. Random vectors and sequences of random variables
5. Joint and marginal laws
6. Convergence of sequences of random variables
7. Approximations by classical distributions

### 2. Statistics

1. Descriptive statistics
2. Double statistical series, different types of regression
3. Estimates: definitions, estimation by confidence intervals, etc.

## Overview

### Description

The objective of this course is to learn how to design and implement a software system taking into account non-functional properties such as maintainability and scalability. Since static aspects were covered in the INFO641 module using an object-oriented approach, the focus here is on the dynamic aspects of the system, i.e., its behavior.

### Objectives

This course aims to enable students to analyze and design the behavior of a software system using UML notation, in particular by using use case, sequence, and state diagrams.

This course aims to raise students' awareness of the concepts of non-functional software properties, with an emphasis on maintainability.

This course also aims to enable students to design and implement software systems using best practices in software engineering (design patterns). Students will thus be able to make informed design choices based on the desired characteristics of the software, and to put into practice software patterns such as strategy, factory, adapter, singleton, and decorator.

## Teaching hours

Lectures	Lecture	7.5
TD	Tutorials	6
Lab	Practical work	24

## Mandatory prerequisites

Basic concepts in object-oriented programming: classes, inheritance, polymorphism, abstract classes, interfaces, event-driven models, graphical user interfaces

OR

Completion of the INFO634\_IDU module

## Course outline

1. Analysis and design of dynamic aspects with UML (sequence diagrams, collaboration diagrams, and state transition diagrams)
2. Design patterns for scalable software products

## Distributed Networks and Systems (INFO733\_IDU)

Polytech Annecy-  
Chambéry  
component

## Presentation

### Description

A course on networks and the Internet is fundamental to the training of engineers and IT professionals, as it provides the basis for understanding modern communication systems. In the era of global connectivity, where data exchange is constant and essential to all sectors (health, finance, industry, education, etc.), mastering the principles of networks allows us to understand how information flows, how infrastructures are organized, and how to secure communications. This course develops key skills such as network configuration, traffic analysis, management of protocols such as TCP/IP, and the adoption of advanced concepts such as routing, virtualization, and decentralized architectures. It also prepares students for current issues related to cybersecurity, 5G, and the Internet of Things (IoT). In short, it is an essential foundation for designing, maintaining, and upgrading the digital systems of today and tomorrow.

### Objectives

This course provides the fundamental concepts necessary for understanding computer networks and deploying distributed applications and systems. The course will begin with an introduction to Internet architecture and application protocols. It will then present transport protocols and the structure of IP addressing. The socket interface will be presented, as well as the concept of middleware. Distributed algorithms will be introduced through concrete examples of applications. This will provide the essential foundations for deploying networked and distributed applications.

### Teaching hours

Lectures	Lecture	6 p.m.
Tutorial	Tutorials	4 p.m.
Lab	Practical Work	4

### Mandatory prerequisites

Knowledge of a programming language

---

## Course outline

1. Introduction to Internet architecture
2. Application protocols
3. Transport protocols: TCP, UDP
4. IP addressing
5. Socket Programming
6. Middleware and Distributed Algorithms
7. Case studies

Practical assignment titles

- Setting up an IP network
- IP routing
- Frame capture and in vivo observation (4 hours of practical work)
- Development of network applications (chat server)
- Distributed algorithms

---

## Overview

### Description

The Data Analysis and Visualization module will provide students with a set of techniques for analyzing and visualizing different types of data: structured, unstructured, and graphs. The module will highlight a number of tools to help students with this task.

### Objectives

The aim of this module is to introduce students to data visualization and enable them to understand how, when used correctly, visualization is a useful analysis tool. The module addresses how we can exploit the functioning of the brain to facilitate understanding through good visualization, addressing concepts such as perception, color theory, and the principles of dashboard construction. This will enable students to analyze a visualization and understand why it works or doesn't work, as well as to produce effective visualizations that facilitate decision-making.

## Teaching hours

Lectures	Lecture	12
Tutorial	Tutorials	23.5

## Mandatory prerequisites

Basic computer skills

## Course outline

1. The course is divided into two parts: theory and practice.

In the theoretical part

1. Introduction to visualization: why, history, etc.
2. Do's and don'ts – an overview of different types of diagrams
3. Color theory
4. Perception
5. Principles for building dashboards In the practical section, two approaches
  1. Tableau – PowerBI-type tool, Excel ++
  2. Python and JavaScript

## Overview

### Description

The course presents the concepts and technologies used in the development of modern web applications based on the JavaScript language.

### Objectives

The objective of this course is to provide an overview of modern web technologies in JavaScript and NoSQL databases.

### Teaching hours

Lectures	Lecture	12
Tutorial	Tutorials	24

### Mandatory prerequisites

- Development of static pages with HTML, CSS
- CSS frameworks

---

- Algorithms and data structures

## Course outline

The course first introduces JavaScript programming concepts for both frontend and backend development, then provides knowledge on the elements to implement in a web application developed with JavaScript technologies. We will then study the use of frontend and backend frameworks to implement the application's interface and internal logic. Finally, we will show how to deploy such an application so that it can be scaled.

A concrete project will then be carried out in groups to implement these elements.

---

## Targeted skills

By the end of this course, students should be able to:

- be familiar with the different elements that make up the layers of a full-stack application and how they interact
- know how to set up a back-end such as an API using NodeJS
- be able to use a NoSQL database and communicate with the backend
- be able to develop an interface using front-end frameworks
- know how to program in JavaScript and TypeScript

## Overview

### Description

This course aims to explore the economic transformations brought about by digital technologies and analyze their implications for markets, businesses, and public policy. It addresses key topics such as digital platforms, the data economy, disruptive business models, the regulation of digital giants, and the impact of artificial intelligence on productivity. Through an approach combining economic theory, case studies, and quantitative analysis tools, students develop a deep understanding of the dynamics of the contemporary digital economy.

### Objectives

The objective of this course is to acquire the analytical and methodological tools needed to understand the economic, legal, ethical, and political aspects of data governance and its uses. We will present the wide variety of private and public, national, European, and international actors involved in order to understand who defines the standards, rules, and protocols for data processing, and for what reasons. This will enable us to understand how these standards are applied at the technical, political, and social levels. We will focus in particular on issues relating to privacy, trust, and the data economy.

## Teaching hours

Lectures	Lecture	3 p.m.
Tutorial	Tutorials	9 p.m.

## Overview

### Description

Students must be aware that quality, environmental, and occupational health and safety management systems are now essential in business. They must therefore have sufficient knowledge of these systems in order to take them into account and integrate them into their engineering work.

### Objectives

- Understand the concepts and requirements of quality management (ISO 9001), safety (ISO 45001), and environmental (ISO 14001) standards.
- Learn how to implement an integrated QSE management system tailored to the specific structure and needs of an organization.
- Acquire the skills necessary to identify, assess, and manage risks related to quality, safety, and the environment.
- Explore auditing and monitoring techniques to ensure compliance and continuously improve the integrated management system.

---

## Teaching hours

Lectures	Lecture	9
Tutorial	Tutorials	10.5

---

## Mandatory prerequisites

None

---

## Course outline

### Topic 1: Quality Management

1. Introduction to quality management;
2. Standards: definition and history of quality, principles of certification;
3. Continuous Improvement: Kaizen, 5S, Lean, Six Sigma;
4. Process Approach;
5. TD: Computer modeling of a process, BPM, web publishing. Theme 2: Environmental Management

1. The environment, sustainable development, carbon footprint;
2. What is an EMS?
3. Standards, challenges;
4. The ISO 14001 standard;
5. The EMAS standard;
6. Implementing an EMS;
7. Practical work: Auditing a company's EMS, proposing eco-cards. Theme 3: Health and Safety at Work:

1. General information and challenges;
2. Stakeholders;
3. Legislation and OHS management system standards;
4. OHS and CSR

---

## Targeted skills

- Ability to interpret and apply quality, safety, and environmental management standards.
- Ability to design and implement an integrated QSE management system within an organization.
- Skills in risk management and QSE performance evaluation.
- Mastery of audit and monitoring techniques to ensure compliance and continuous improvement.

---

## Presentation

### Description

This component of SHES is divided into two separate courses: Management and Ethics. The aim of this module is to understand the human and communication aspects of management and to develop students' managerial assertiveness.

### Objectives

- Develop managerial assertiveness
- Manage a team responsible for implementing a project
- Understand the tasks and professional skills involved in implementing the project
- Know how to take a step back from complex situations and arbitrate conflicting needs related to project design
- Adopt an ethical and responsible management style

### Teaching hours

Lectures	Lecture	18
Tutorial	Tutorials	7.5

---

## Mandatory prerequisites

None

---

## Course outline

Topic 1: Team management

- Understanding - The human dimension of management
- Communicate - The relational dimension of management

Topic 2: Ethics and psychosocial risks (PSRs)

- Mental load and information overload
- Stress at work and burnout
- Harassment (moral and sexual)

To supplement this topic on PSRs, students also have access to an e-learning training platform provided by INRS. This leads to the award of a certificate of achievement if 66% of the students' answers are correct.

---

## Targeted skills

- Be able to express expectations and needs. Know how to communicate ideas clearly.
- Adopt active listening and establish positive professional relationships.
- Ability to analyze complex situations, evaluate available options, and make informed decisions based on organizational objectives.
- Know how to recruit, train, and develop team members, rally them around common goals, and foster a collaborative and productive work environment.
- Ability to identify, analyze, and solve problems encountered in the workplace using appropriate methods and tools.

## Presentation

### Description

This course prepares students for the TOEIC ("Test of English for International Communication") exam, specifically to obtain a minimum score of 785 points (out of 990).

The TOEIC test will take place at the end of this semester at each of the sites on very similar dates. (Make-up sessions will take place in week 9).

Students are assessed throughout each semester. The final assessment consists of a 1-hour, 1.5-hour, or 2-hour exam, depending on the semester.

### Objectives

**Specific objectives: at the end of this course, students will be able to:**

continue practicing TOEIC exercises (4 parts of listening comprehension) + entire tests

work on a variety of audio and video materials (general English, business English, and specialized English) and speak spontaneously, interacting with the class

speak in a prepared manner and interact spontaneously through scientific presentations and on topics or issues related to the business world (job interviews, negotiations, discussions on technical/professional projects, wage inequality, international mobility, etc.)

**Specific objectives: at the end of this course, students will be able to:**

continue grammatical revision on: the conditional tense; all other tenses; expressing suggestions and modality/the passive voice; verbal structures (infinitive/ing)

improve their grammatical and lexical knowledge (general English, business English, and English specific to their scientific field), both in class and independently, validating their progress through regular tests.

## Teaching hours

## Presentation

### Description

This course is a training course in professional English. Students will work on their fluency in the five language skills by enriching their technical and professional vocabulary, through role-playing, cultural contributions, and written exercises (different topics from 602 and 702).

Activities will be carried out individually, in pairs, and/or in groups. Students will be assessed throughout the semester.

### Objectives

The objective is to improve students' autonomy in the English-speaking workplace in an international context.

## Optional internship S8 (PROJ800\_PACY)

Polytech Annecy-  
Chambéry  
component

### In brief

- **Languages of instruction:** French
- **Open to exchange students:** Yes
- 

## Overview

### Description

The optional internship aims to enrich students' academic and professional experience by offering them a practical opportunity to apply their knowledge and acquire new skills. An optional internship can be carried out in **France or abroad**. It must comply with the same general conditions as compulsory internships.

### Objectives

- **Acquisition of specific skills related to the specialization;**
- **Refining career goals and/or** gaining confidence and independence through the completion of a project or specific tasks;
- Establish valuable professional contacts that can help in future job searches.

## Presentation

### Description

This support is open to all students at the school: students, apprentices, and Continuing Education employees. It is not mandatory, as it is primarily intended for students who need it to succeed in their training. This semester, it is scheduled into the timetable for each course, with a total of 16 hours.

Support may take the form of refresher courses, upgrading courses, or support in the main areas of the training programs.

Peer tutoring is encouraged and the educational resources of the Polytech Network are used (↗ <https://eplanet.polytech-reseau.org/> ).

### Objectives

To promote the success of all students in their educational journey.

## Overview

### Description

This is a professional internship as a technician or assistant engineer. The internship is to be carried out in a company or research organization on a topic closely related to the student's area of expertise, on a full-time basis and with a **maximum of 50% teleworking**.

### Objectives

This internship, carried out within a company or organization whose activity is representative of the specialty chosen at the school, should enable students to:

- Integrate and participate in a professional organization;
- Discover professional methods and practices;
- Apply the student's theoretical and practical knowledge;
- Carry out tasks similar to those of technicians or assistant engineers.

## Overview

### Description

With the advent of digital technology, data is becoming increasingly ubiquitous and so abundant that it is no longer possible to analyze it on a personal computer. Big Data was born among the Internet giants (Google, Amazon, Facebook, Yahoo) and has given rise to numerous tools that have become open source, such as Big Table, Hadoop, and MongoDB, to name but a few. The Big Data module presents the different approaches that exist for handling massive amounts of data, namely batch processing (with Hadoop and Map Reduce), live processing (with Apache Spark), and finally the lambda architecture, which combines the two approaches.

### Objectives

By the end of the course, students will be able to:

- understand the three architectures and their use
- implement the three architectures

## Overview

### Description

This course provides an overview of machine learning, from its main principles to its implementation using specialized algorithms. The principles of learning are presented through a typology of the problems addressed and categories of learning. In concrete terms, formulating a learning problem involves specifying objectives, data, and models together. The formulated problem is then solved using an appropriate algorithm. While the main principles of learning apply to the various problems addressed, their resolution requires different algorithms. This course focuses on supervised and unsupervised classification problems. In this context, the main families of models (trees, neural networks, rules, etc.) and associated algorithms will be approached through practice and then revisited afterwards in order to extract the principles and concepts specific to the different methods.

### Objectives

By the end of this course, students will be able to

- formulate a learning problem using a triplet (data, objectives, models)
- to position a particular problem within the typology of problems addressed in machine learning
- formulate a procedure for evaluating a learned system

## Overview

### Description

This course presents the statistical methods used in data analysis (factorial analysis) or in modeling the explanatory relationship of a variable (regression) and positions their use in the pyramid of modern business intelligence.

The first part of the course is devoted to factor analysis, which, by comparing the spaces of individuals and variables, enriches interpretation and reveals the internal structure of the data. The nature and coding of data lead to two essential variants of factorial methods, namely principal component analysis (PCA) and multiple correspondence analysis (MCA), combined in multiple factorial analysis (MFA).

The second part presents different regression models and methods for estimating their parameters, from linear models to more complex models, with potentially unknown structures, adapted to different assumptions about data distribution.

### Objectives

Define a model suited to a data set based on one or more data analysis tools Estimate a multilinear statistical model and interpret the results obtained

Use a model for explanatory or predictive purposes

## Presentation

### Description

The first project in semester 6 analyzed what data was needed to solve a problem, how to obtain it, and how to consolidate it so that it could be used. This second project aims to consider the next step in a Data Science project, namely data analysis and visualization: selecting the data characteristics to be used for analysis and considering the best ways to visualize this data to highlight it. This project will again start with a problem and, as in PROJ 631, seek to find the necessary data, format it, and then perform analysis and visualization. This module could be the subject of a challenge between a partner company and the students in the program. The company would provide the data, and a joint effort between the company and the students could lead to a solution to the problem at hand.

### Objectives

At the end of this course, students will be able to:

- understand a problem statement related to the use of Big Data
- propose a comprehensive approach to solving the problem as a team
- design tools for collecting and formatting data
- visualize and highlight data

---

- perform qualitative and quantitative data analysis

---

## Teaching hours

## Overview

### Description

This course aims to teach students how to master large-scale distributed systems, particularly those that manage large amounts of data. We address both conceptual issues (the fundamentals of distributed algorithms) and technical issues (implementing scalable architectures). Particular attention will be paid to performance, robustness, and environmental aspects.

### Objectives

- Understanding issues related to large scale, heterogeneity, asynchrony, fault detection, resource consumption;
- Implementing scalable architectures (data, services).

## Teaching hours

Lectures	Lecture	12
Tutorial	Tutorials	13.5
Lab	Practical Work	15

## Mandatory prerequisites

INFO632 (operating systems) and PROJ731 (concurrent programming, data flow).

## Course outline

1. Distributed systems foundations
2. Architectures
  1. Client-server model
  2. Peer-to-peer model
  3. Complex architectures
3. Distributed algorithms
  1. Broadcast
  2. Failure detection
  3. Consensus
4. Large-scale data management
  1. Redundancy
  2. Distributed hash tables
  3. Large-scale distributed data management systems, NoSQL
5. Simulation of large-scale distributed systems
  1. Large-scale experiments
  2. Simulation approaches

- 

## Overview

### Description

This course focuses on the design and implementation of distributed databases for Big Data. Two aspects are covered: data organization (representation, storage, distribution) and processing organization (definition, distribution, retrieval).

### Objectives

The objective of this course is to provide students with the knowledge and skills they need to choose, design, and implement a data representation and processing system tailored to the needs of the application or computer system to be developed in a big data context.

### Teaching hours

Lectures	Lecture	6
TD	Tutorials	6
Lab	Practical work	28

---

## Mandatory prerequisites

INFO633\_IDU

---

## Course outline

1. Introduction to distributed databases for Big Data: requirements and characteristics
2. Fundamental concepts of NoSQL DBMS (vs. SQL): implicit schema, key-value pairs, document-oriented or column-oriented databases
3. CAP theorem and BASE properties of NoSQL DBMS
4. Development of NoSQL distributed databases (Redis, MongoDB, Neo4j, Parquet)

Tutorials and practical work will enable students to implement the various technologies. A mini integrative project carried out in teams will conclude the module.

## Overview

### Description

The role of Data Scientist consists of three parts:

- Knowledge of statistics
- Knowledge of computer science
- Business dimension

The objective of this module is to focus on the third part, namely the business dimension, through meetings with professionals who are confronted with Data Science issues.

### Objectives

By the end of this course, students will be able to:

- identify the tasks assigned to a data scientist in a company
- position themselves in the job market

## Overview

### Description

The Research and Development Project (PRD) is an educational activity involving a partnership between the PAC School and a professional organization or research laboratory. This activity allows students to acquire (or strengthen) their experience in research and development.

### Objectives

The R&D Project aims to strengthen engineering students' R&D skills by enabling them to

- carry out and manage a research and development project in an industrial or research context,
- apply and expand the skills acquired during their training in their specializations
- solve problems while taking into account constraints such as cost, deadlines, quality, etc.
- interact within a team,
- organize themselves to achieve set objectives by planning the various stages,
- effectively monitor progress.

---

## Teaching hours

PTUT	Tutored project	15
PROJ	Project	125 hours

---

## Mandatory prerequisites

First year of the engineering program (FI3) for all specializations

---

## Course outline

The first sessions are supervised by teaching and scientific tutors.

Students carry out bibliographic, analytical, and synthesis work, partly independently, during this period.

Supervisors agree on the frequency of meetings to review progress, in order to provide the best possible support for students in carrying out their projects.

---

## Presentation

### Description

This course prepares students for their entry into professional life. Conducting or participating in a meeting: vocabulary and structures related to this aspect while continuing to work on the four skills, but with an emphasis on realistic scenarios (role-playing, acquisition of technical vocabulary (depending on the site) and business vocabulary, etc.). But also public speaking through presentations given by students in groups and/or individually, on topics illustrated by press articles or video materials (VTD: Video, Talk and Debate). Students are assessed throughout each semester. The final assessment consists of a 1-hour, 1.5-hour, or 2-hour exam.

### Objectives

**Specific objectives: at the end of this course, students will be able to:**

Continue lexical and grammatical revisions focusing specifically on the areas tested in the TOEIC. Intensify training on TOEIC exercises (7 parts) / entire tests.

**Specific objectives: at the end of this course, students will be able to:**

listen regularly to news on English-language news sites (CNN, BBC, Sky News, etc.) and be able to succinctly summarize the main points orally, interacting with the class group

conduct research (in groups and individually) to develop an innovative (professional/cultural) project as a team, to be presented in class, after anticipating and simulating the steps involved with economic actors capable of helping the team to develop it, according to the stages of a credible business plan: writing emails, telephone interviews, recruitment, fundraising, etc.

present the collective project.

## Presentation

### Description

This course is a training course in professional English. Students will work on their fluency in the five language skills by enriching their technical and professional vocabulary, through role-playing, cultural contributions, and written exercises (different topics from 602, 702, and 802).

Activities will be carried out individually, in pairs, and/or in groups. Students will be assessed throughout the semester.

### Objectives

The objective is to improve students' autonomy in the English-speaking workplace in an international context.

### Teaching hours

Tutorials

Tutorials

21

---

## Mandatory prerequisites

Minimum TOEIC score of 785 – Semester 801 and/or 802 completed

---

## Course outline

Various presentations by professionals, mainly English-speaking teachers or external speakers.

---

## Targeted skills

Communicate independently, both orally and in writing, in all situations in a professional setting.

---

## Overview

### Description

This course aims to address multi-criteria problems from two different angles: optimization and decision support. In both cases, the general problem is presented before detailing the different approaches. Multi-criteria optimization is addressed using evolutionary algorithms (genetic algorithms, genetic programming). The various elements of artificial evolution are presented before addressing multi-criteria optimization through dominance-based approaches and presenting the Non-dominated Sorting Genetic Algorithm (NSGA). Multi-criteria decision support is used in decision-making problems to find the best possible solution(s) and make the decision-making process more explicit, rational, and effective. The decision-maker is assisted by automatic tools to construct one or more preference models. The different types of problems addressed and models developed lead to various methods and implementation tools presented in this course.

### Objectives

- Define the key steps in the modeling phase: set of alternatives, problem, criteria;
- Choose an appropriate method for finding optimal solutions or compromises;

- Implement a decision support method on a concrete case using appropriate computer tools.

## Presentation

### Description

Data has become crucial information for companies, which seek to leverage it. This leverage may be internal, for example to better understand their customers, but as is often the case with Internet companies, it involves reselling this data to third parties for targeted advertising, for example. It is becoming important to master data acquisition and exploitation.

This project deals with data in the broadest sense and should highlight issues such as data management policies, security, data confidentiality, and data exploitation.

The specific topic is to be defined in collaboration with the company.

### Objectives

- Obtain data that may be confidential or private.

- Understand the concepts of data security;

- Know how to manage data;
- Apply a security policy to data.

## Presentation

### Description

This module follows on from modules DATA832 and INFO831, in which the basics of data science were presented through the various paradigms of machine learning and exploratory statistics and tested using basic algorithmic machinery, highlighting the limitations of basic modeling tools. This module presents a set of advanced methods that extend the fundamentals of learning. Each approach improves the learning process by focusing on a particular aspect, such as reducing decision variance, handling nonlinear problems, or learning from a very large number of examples and automatically extracting features. A conceptual presentation of the different methods will be accompanied by a discussion of their implementation and experimentation based on concrete cases from research and development.

### Objectives

By the end of this course, students will be able to:

- present applications that have contributed to the success of modern approaches in machine learning and analyze their characteristics
- formulate the basic principles and concepts of the main modern approaches

- install, configure, and use advanced learning libraries in Python
- experiment with advanced learning techniques for object classification using massive reference databases
- design and develop their own advanced learning application in the context of big data

## Presentation

### Description

#### Description

Previous projects (PROJ 631, 831, 931) focused on development and operation on a personal computer. In this project, the aim is to go beyond the limitations of a single machine and consider a Big Data approach and its 3Vs: Volume, Velocity, and Variety. For this project, students will be required to provide a turnkey system (via a virtual machine or Docker container) that addresses the problem at hand. They will therefore need to identify the necessary architecture to implement, the tools to use or create, and the databases to define, all within a cloud environment.

### Objectives

- Understand a Data Science problem in its entirety;
- Define the complete process from data acquisition to data visualization and results;

- Design a system that requires massive data and distributed computing;
- Provide a turnkey system to replicate the process.

---

## Teaching hours

## Overview

### Description

The internship must be completed in a company or research organization related to the student's area of expertise, on a full-time basis and with a **maximum of 50% teleworking**.

### Objectives

This is an internship carried out within a company or research laboratory, department, or organization whose activity is representative of the student's specialty. This internship should enable students to:

- apply the student's theoretical and practical knowledge;
- verify their aptitude for engineering roles.

## Presentation

### Description

Common economic concepts used to characterize the economic situation of a company, their content and meaning, and understanding the distinction between economics and finance.

Concepts of labor law.

### Objectives

This course aims to enable students to:	Level	At the end of this course, students will be able to:
understand the major changes in the economic world (production economy/market economy) and the elements of the business environment, their roles, and their expectations.	Master	understand the economic workings of their company and/or projects
understand the challenges facing the company and why a company must evolve,	Master	Participate in the necessary evolution of the company

both in terms of its services (adapting to demand, innovation) and its organization (cost reduction, continuous improvement)		
know the common economic terms used to describe the company's economic situation, their content, and their meaning, and know and understand the difference between economics and finance	Master	of reading an income statement and a balance sheet to draw up a simple provisional budget and an economic approach to an improvement measure
Have a basic understanding of labor law	Know	Knowing your rights within the company

## Teaching hours

Lectures	Lecture	8 p.m
Tutorial	Tutorials	12

## Mandatory prerequisites

- Have completed an internship in a company
- Knowledge of basic economic vocabulary
- Knowledge of the company, its structure, and its management

## Course outline

1. Knowledge of the company
  - The economic environment (customers, suppliers, shareholders, banks, government, local authorities, social organizations, competitors, social partners, etc.)
  - Changes in the economic world and their impact on fundamental economic reasoning (market economy, globalization, etc.)
  - Customer needs, the need for innovation
  - Different possible scenarios for increasing profits
  - The concept of useful value for the customer and economic waste
2. The concept of economics
  - Definition of the main terms used in the income statement (influence of inventories, depreciation mechanism, payroll and its content, taxes, profits, availability of earnings)
  - Definition of key terms in the balance sheet (fixed assets, receivables/payables, concept of provisions and risk, financing: share capital and loans)

- The dynamics between the income statement and balance sheet (the main mechanisms, interests of the various stakeholders: shareholders, bankers, employees, etc.)
- The company's cash flow and its availability over time (VAT mechanism, depreciation, and borrowing)
- The implementation of economic indicators at the workshop level (types of indicators, limitations)
- Drawing up a simple provisional budget (principle)

### 3. Introduction to legislation

- Different types of employment contracts
- The powers of the employer
- Working conditions
- Remuneration for work
- Events affecting the employment contract
- Termination of the employment contract
- Procedures and consequences of dismissal
- Employee representation

## Introduction to Sustainable Development and CSR - Cognitive Development (SHES511\_PACYFISA)

Polytech Annecy-  
Chambéry  
component

### In brief

**Languages of instruction:** French **Teaching methods:** In person  
➤ **Open to exchange students:** Yes

- 
- 

## Presentation

### Description

The Cognitive Development course aims to open engineering students' minds to SHEJS and provide them with useful guidelines for advancing their projects, both personally and professionally.

The Sustainable Development section lays the foundations for ethics and CSR.

### Objectives

Acquire benchmarks and tools to optimize learning

Learn the basics of corporate social responsibility and sustainable development

---

## Teaching hours

Lectures	Lecture	16
Tutorial	Tutorials	12
Lab	Practical Work	4

---

## Mandatory prerequisites

None

---

## Course outline

### 1. Introduction to sustainable development

- Why companies take the environment into account in their strategy (environmental issues, industrial accident prevention, environmental regulations, etc.).
- Introduce the environmental management system (as defined by ISO 14001), its principles, organization, and benefits for businesses.
- Introduce other environmental approaches and how they fit together (energy management, carbon accounting, and eco-design). Normative aspects are also introduced.

### 2. Cognitive development.

- Understanding SHEJS and their usefulness in engineering training
- Learn how to manage a project in the broadest sense (neuroscience: plasticity and objectives, the importance of defining objectives, mental processes including memorization and the forgetting curve, etc.)
- Finding your bearings to optimize learning (neuroscience: 4 pillars of learning, role of attention, VAKOG model.....)
- Finding your bearings to be effective (optimal conditions for brain use, identification of personality profiles—the "Brain Preferences" model—organization, identification of resources. )

## Presentation

### Description

This course prepares students for the TOEIC (Test of English for International Communication) exam, specifically to obtain a minimum score of 785 points (out of 990).

With the aim of developing all four skills, this course also serves as an introduction to public speaking through presentations given by students in groups or individually on topics illustrated by press articles or video materials (VTD: Video, Talk and Debate, as well as written work).

Students are assessed throughout each semester.

### Objectives

**Specific objectives:** at the end of this course, students will be able to:

listen regularly to news on English-language news sites (CNN, BBC, Sky News, etc.) and be able to succinctly summarize the main points orally, interacting with the class group.

work with a variety of audio and video materials and speak spontaneously in an interactive manner with the class

to speak in a prepared manner and interact spontaneously through individual presentations (self-presentation and/or article reports, such as "quizzes") and presentations in pairs (various topics)

work on telephone conversations (comprehension/production)

practice TOEIC exercises (4 parts of listening comprehension) + entire tests

## Presentation

### Description

The aim of this module is to assess the various IT skills of apprentices when they enter S5. It provides an overview of their learning so that support sessions can be organized on Thursday afternoons for apprentices who do not have the prerequisites for the IT modules of the program. This involves identifying the support needs of each apprentice.

### Objectives

- Identify apprentices' IT support needs by assessing various aspects of IT (analysis, design, programming, etc.).
- Based on the skill levels validated, direct apprentices to the appropriate support sessions.

## Presentation

### Description

The General Discrete Mathematics course presents the fundamental concepts for the study of discrete structures. It develops essential methods and tools for modeling, analyzing, and solving mathematical and computer science problems.

### Objectives

- Acquire the theoretical foundations necessary to understand the discrete structures used in mathematics and computer science.
- Manipulate sets, relations, and functions, and use these concepts in concrete problems.
- Understand and use formal languages to model problems and study simple automata.
- Master the fundamental concepts of number theory.
- Apply probability and discrete statistics methods to model and analyze discrete random phenomena.
- Prepare the groundwork for applications in algorithmics, cryptography, theoretical computer science, and data analysis.

## Presentation

### Description

This course aims to analyze what data is needed to address a given problem, acquire it, and then ensure its consistency and completeness through statistical analysis. The data may be either structured data, as found in Open Data approaches, or unstructured data such as text (social media reviews: recipes, restaurants, etc.).

### Objectives

By the end of this course, students will be able to:

- acquire more or less structured data,
- clean up data,
- compensate for missing information in the data.

## Teaching hours

## Behavior and Dynamic Modeling (INFO636\_IDUFISA)

## Presentation

### Description

The objective of this course is to learn how to design and implement a software system taking into account non-functional properties such as maintainability and scalability. Since static aspects were covered in module INFO641 using an object-oriented approach, the focus here is on the dynamic aspects of the system, i.e., its behavior.

### Objectives

This course aims to enable students to analyze and design the behavior of a software system using UML notation, in particular by using use case, sequence, and state diagrams.

This course aims to raise students' awareness of the concepts of non-functional software properties, with an emphasis on maintainability.

This course also aims to enable students to design and implement software systems using good software engineering practices (design patterns). Students will thus be able to make informed design choices based on the desired characteristics of the software and to put into practice software patterns such as strategy, factory, adapter, singleton, and decorator.

### Teaching hours

Lectures	Lecture	9 a.m.
Tutorial	Tutorial	9 a.m.
TP	Practical Work	28

### Mandatory prerequisites

Basic concepts in object-oriented programming: classes, inheritance, polymorphism, abstract classes, interfaces, event models, graphical user interfaces

---

## Course outline

1. Analysis and design of dynamic aspects with UML (sequence diagrams, collaboration diagrams, and state transition diagrams)

32

## Mandatory prerequisites

Basic understanding of how a business operates  
economics

## Course outline

### 1. General accounting: the core of the accounting information system

- Presentation of the accounting information system
- Presentation and functioning of the balance sheet
- Presentation and functioning of the income statement
- Introduction to financial analysis

### 2. Budget management: forecasting, anticipating, and deciding

- Initial budgets
- Cash flow budget
- Provisional balance sheet and income statement

### 3. Cost calculation methods: analyzing data provided by general accounting

- Full cost calculation
- Partial cost calculation

### 4. Investment project analysis

- Analysis of investment profitability
- Financing methods and their implications

### 5. Entrepreneurship

- The various stages, approaches, and steps to be taken before deciding to start a business
- The business plan (its structure and components)
- Existing tools

## Presentation

### Description

The entire course is structured around

- around a scenario involving an industrial company manufacturing coffee makers and coffee machines over a period of six years.
- with practical exercises focusing on:
- Provisional financial statements, dashboards, financial analysis, cost calculation, return on investment, and business strategy.
- Management projects initiated by engineering students in companies

### Objectives

This course aims to enable students to:	Level	By the end of this course, students will be able to:
apply the concepts covered in the management module in a practical way	Master	use management concepts in the context of business projects

develop financial reflexes for managing the company in response to unforeseen events, opportunities, and market conditions	Master	Make decisions during projects based on available financial information

## Presentation

### Description

This course prepares students for the TOEIC (Test of English for International Communication) exam, specifically to obtain a minimum score of 785 points (out of 990).

With the aim of developing all four skills, this course also serves as an introduction to public speaking through presentations given by students in groups or individually on topics illustrated by press articles or video materials (VTD: Video, Talk and Debate, as well as written work). Depending on the location (Annecy or Chambéry), some will be seen at different times during the semester, the year, or even the three years of training.

Students are assessed throughout each semester. The final assessment consists of a 1-hour, 1.5-hour, or 2-hour exam.

### Objectives

**Specific objectives: at the end of this course, students will be able to:**

work on telephone conversations (comprehension/production)

listen regularly to news on English-language news sites (CNN, BBC, Sky News, etc.) and be able to succinctly summarize the main points orally, interacting with the class

work on a variety of audio and video materials and speak spontaneously in an interactive manner with the class

speak in a prepared manner and spontaneously interact through individual presentations (self-presentation and/or article reports, such as "quizzes") and presentations in pairs (various topics)

practice TOEIC exercises (4 parts of listening comprehension) + entire tests

## Presentation

### Description

In this module, engineering students will be required to carry out a mainly technical project within the company, implementing a structured and effective approach.

The technical component is considered in a broad sense (products, production processes, organization, etc.).

This project may be continued in semester 8, during which engineering students will develop its economic component. If company constraints do not allow this, it will be possible to choose a new project.

### Objectives

Situate your project within the company's overall strategy and understand its challenges:

- assess the importance of your project in relation to other ongoing projects
- anticipate and take into account changes in the company to ensure the project's sustainability Broaden the range of possible solutions:
- justify choices

- systematically integrate relevant health, safety, and environmental aspects

## Mandatory prerequisites

- Herrmann's Brain Preferences Model
- The "organization" (time management, delegation) and "problem solving" approaches covered in Cognitive Development/Intro to Management (SHES591)

Preparation/presentation of the preparatory topic "Project Management and Extended Technical Project Specifications"

## Course outline

1. Inventory of the main strategic, technological, and organizational changes at work in the company and in society, and their consequences on human resource management: historical and sociological retrospective
2. In-depth study of the concept of responsibility and accountability
3. Personal development:
  - basics of responsible and assertive communication
  - Transactional Analysis approach: self-diagnosis of "ego states," conditioning messages, life positions

### Practical work titles

- Acquisition of project terminology (challenges, objectives, indicators, resources, constraints, PDCA, validation, sustainability)
- Development of a "context" grid and definition of the qualities and expectations of a project manager based on Herrmann
- End of "technical" project period, "management" project led: Monitoring and support work on projects; mutual field advice
- Methodological contributions: argumentation and demonstration
- Contributions to written/oral expression

## Presentation

### Description

This course prepares students for the TOEIC test ("Test of English for International Communication") and, more specifically, for obtaining a minimum score of 785 points (out of 990).

The TOEIC test will take place at the end of this semester at each of the sites on very similar dates. (Make-up sessions will take place in week 9).

Students are assessed throughout each semester. The final assessment consists of a 1-hour, 1.5-hour, or 2-hour exam, depending on the semester.

### Objectives

**Specific objectives: at the end of this course, students will be able to:**

continue practicing TOEIC exercises (4 parts of listening comprehension) + entire tests

work on a variety of audio and video materials (general English, business English, and specialized English) and speak spontaneously in an interactive manner with the class

speak in a prepared manner and interact spontaneously through scientific presentations and on topics or issues related to the business world (job interviews, negotiations, discussions on technical/professional projects, wage inequality, international mobility, etc.)

**Specific objectives: at the end of this course, students will be able to:**

continue grammatical revision on: the conditional tense; all other tenses; expressing suggestions and modality/the passive voice; verbal structures (infinitive/ing)

improve their grammatical and lexical knowledge (general English, business English, and English specific to their scientific field), both in class and independently, validating their progress through regular tests

## Overview

### Description

In this module, engineering students will be required to carry out an economics-oriented project within their company (either a continuation of the project from semester 7 or a new project).

The aim of this project is for engineering students to realize the importance of economic factors in the smooth running of any industrial project and their impact on the company.

### Objectives

Measure the importance of economic factors in the management of any project (decision to launch, investment strategies and decisions, management and performance indicators) and for the effective management of all or part of the company (a department, a workshop, a production line, etc.):

- Use management knowledge in the management of a company project Master the main economic and financial parameters of the company:
- take economic and financial data into account when undertaking an industrial project

Make the numbers "speak," know how to interpret them clearly so they can be understood and used at the operational levels of the company:

- presenting and using economic and management data for an industrial project

---

## Teaching hours

## Course outline

### 1. Legislation

- Sources of labor law and judicial organization
- Key elements of the employment contract
- Working hours/salaries/paid leave
- Employee representation
- Elements of civil and criminal liability of managers and their employees

### 2. Ergonomics

- Ergonomics (origin, definition, scope)
- Workstation design
- Physical fatigue
- Mental fatigue
- Thermal comfort
- Visual comfort
- Auditory comfort
- Workstation analysis method and ergonomic approach
- Contribution of ergonomics to the prevention of hardship

### 3. Sustainable engineering

### Description

Project management and leadership Skills management

### Objectives

This course aims to enable students to:	Level	At the end of this course, students will be able to:
acquire an understanding of the collective dimension of day-to-day business management and change management	Master	define skills management understand the challenges of job and skills management understand the philosophy of GPEC (forward-looking management of jobs and skills) and its direct link to company strategy

		understand common HR vocabulary: skills, qualifications, performance, jobs, etc.
		identify and understand the role of the engineer in the GPEC process
identify and understand the use of the main job and skills management tools (job map, job descriptions, skills frameworks, appraisal interviews, etc.)	Mastery	<p>understand the principles behind the creation of these tools</p> <p>be able to write a simple job description</p> <p>recruit</p> <p>understand the recruitment process and its main stages</p> <p>identify pitfalls to avoid</p>
understand the contingency of the recruitment process (depending on the profile, time available, budget, etc.)	Master	<p>understand the legal framework for recruitment (basic concepts)</p> <p>be familiar with the main stages of the recruitment interview</p> <p>understand judgment biases and be able to avoid them</p> <p>understand the basic principles of assessment tools (tests)</p>

## Teaching hours

Lectures

Lecture

28

## Mandatory prerequisites

- The entire second-year module: personal development
- Definition of the "team management/leadership" project
- Knowledge of the company

## Course outline

1. Leading and managing a project
  - Leading a team: taking on the role of leader or manager; status, roles, performance indicators, and team monitoring; adaptive management

- The group: its personality, its evolution, the role of the leader, group phenomena (application to meeting facilitation)
- Leading a "sensitive" project: lateralizing it, identifying and developing the roles of the various players, adapting to each type
- Leading change: crisis or change, individual and collective emotional cost, qualities of the leader, successive stages and support
- Managing conflict: preventive, curative, interindividual, and collective approaches, from conflict to negotiation: prerequisites for negotiation, range of tactics and strategies used

## 2. Skills management

- Theoretical aspects

2.1.1. The history of skills management (career management, job management, etc.) 2.1.2. The conventional and legal aspects of GPEC

2.1.3. Key definitions (distinction between job and position, competency and performance, etc.)

- The link between job and compensation (collective bargaining agreement, classification/rating, etc.)
- GPEC tools
- Creating a job map

2.2.2. Methodology for creating a job description

2.2.3. Skills frameworks

- Skills assessment
- GPEC as a strategic approach
- Developing a comprehensive action plan

2.3.2. Different ways of implementing GPEC

2.3.3. GPEC stakeholders

1. Recruitment

- The recruitment process

3.1.1. Recruitment: a strategic business tool

3.1.2. The stages of recruitment

- The cost of recruitment
- The recruitment interview
- Interview conditions

3.2.2. Interview support

3.2.3. Conducting a recruitment interview

- Judgment biases to avoid
- Tests
- Types of tests

3.3.2. Methods for the statistical construction of a test

3.3.3. Test validity

#### Practical work titles

- Simulations of difficult communication situations: listening, criticism, conflicts
- Formation of "project management" working groups
- Managerial insights in response to various "management/team leadership" projects
- Preparation for the presentation of projects in the workplace

---

## Presentation

### Description

This course prepares students (who have not yet validated their score) for the TOEIC ("Test of English for International Communication") test and, more specifically, for obtaining a minimum score of 785 points (out of 990).

### Objectives

To develop a number of reflexes and autonomy in relation to the TOEIC or Linguaskill test at the end of S8 in order to achieve the score required for the engineering degree.

### Teaching hours

Tutorial	Tutorials	26 hours
----------	-----------	----------

### Mandatory prerequisites

---

## Course outline

- 1. Review of important grammar points for the TOEIC**
  1. Review of all tenses covered or reviewed in S5, S6, S7, and S8
  2. The passive voice.
  3. Causative structures.
  4. BV / BVing or to BV.
  5. Linking words.
- 2. Listening comprehension**
  1. Recorded dialogues in American, British, and New Zealand English.
  2. Videos in American, British, Australian English, etc.
- 3. Reading comprehension**
  1. Press excerpts
  2. Various texts

## Presentation

### Description

This course prepares students for their entry into professional life. Leading or participating in a meeting: vocabulary and structures related to this aspect while continuing to work on the four skills, but with an emphasis on realistic situations (role-playing, acquisition of technical vocabulary and business vocabulary, etc.). But also public speaking through presentations given by students in groups and/or individually. Students are assessed throughout the semester. Preparation of the engineering theme (English section compulsory) Simulation of an interview in front of two members of the jury and half the class.

### Objectives

To become as independent as possible in their future profession

## Presentation

### Description

In this module, engineering students will be required to carry out a management-oriented project within a company, implementing a structured and effective approach.

The managerial component is considered in a broad sense (hierarchical or cross-functional management, communication, team leadership, training, change management, conflict management, etc.).

The aim of this project is for engineering students to realize the importance and impact of the human factor on the smooth running of any industrial project.

This project may be continued in semester 10 and become the Engineering Project, expanding it to meet the end-of-program expectations.

### Objectives

Develop an effective human approach to project management:

- anticipate the humanly sensitive stages of the project

- define the principles adopted for project management
- identify the obstacles encountered and the actions taken in response
- Monitor and define validation steps with a view to sustainability

Use human resources tools that are appropriate for the company, whether they are already in use or whether this project is an opportunity to propose new ones (skills, training, procedures, facilitation, etc.):

- Implement human resources tools in projects carried out within the company
- if necessary, select new dedicated tools

---

## Teaching hours

Lectures	Lecture	1
Lab	Practical work	8

---

## Mandatory prerequisites

Projects from semesters 5, 6, 7, and 8.

Modules from semesters 5, 6, 7, and 8: SHES511\_PACYFISA, SHES801\_PACFISA, and SHES902\_PACFYSA

---

## Course outline

Launch

Support: human-centered project framing, implementation of project management/problem-solving tools/methods, identification and testing of "Human Resources" tools/approaches useful to the project, critical analysis and areas for improvement

Interim defense in the company, with an active visit organized and led by the engineering student.

## Presentation

### Description

This module aims to understand the scientific approach to a question or need. Two main areas are explored: the first focuses on reviewing scientific literature, and the second on innovation and proposing scientific contributions. The concepts will be put into practice using scientific questions proposed by the teaching team on very open and innovative topics.

\* The first part focuses on scientific documentation, the different types and sources of documents, as well as modes of dissemination (media, scholarly publishers, open science), economic models, and associated quality metrics. The objective is to demonstrate methods for researching, collecting, and synthesizing scientific documents in order to answer a scientific question.

In order to better understand the process of scientific validation of documents, the module offers an introduction to writing scientific document reviews.

This first part then leads to the writing of a literature review (survey paper) on a scientific issue. Depending on its initial quality, the document may be submitted in an improved version, with the teaching team, to a scholarly publisher.

Assessment is based on the submission of two documents: a review (individual submission) and a survey paper (group work).

\* The second part of the module aims to explore the scientific approach to proposing new contributions. Based on the scientific question and the literature review developed in the previous stage, the students, working in teams, will propose an innovative solution that will then be validated through experimentation, interpretation of results, and synthesis/conclusion.

This work will be carried out in supervised sessions and independently. The final deliverables to be assessed will be i) a summary report presenting the contribution, its evaluation, and analysis of the results, ii) an oral presentation, and iii) the documented codes of the contribution.

---

## Objectives

understand innovation and the scientific approach to a question or need:

- \* learn about the types and sources of scientific documents, and know how to select, critique, and synthesize relevant documents related to a scientific question.
- \* Explore the scientific approach to proposing new contributions.

---

## Presentation

### Description

In this module, engineering students will be required to carry out an engineering project within a company, involving technical, economic, and human aspects.

### Objectives

Methodically manage an industrial project in a balanced and effective manner according to its three complementary components—technical, economic, and human—by:

- define and use project management tools for the technical, economic, and human aspects. Anticipate and promote the smooth running of the project;
- analyze and predict potential risks in order to anticipate how to control them
- define and monitor the defined action plan (associated countermeasures).

Use or implement relevant indicators and ensure the sustainability of the project:

- define and use project management indicators covering technical, economic, and human aspects (monitoring and performance indicators)
- identify the means and resources
- ensure the sustainability of results
- draw lessons that can be extrapolated for the future.

## Presentation

### Description

The technology that computer engineers design, develop, or deploy has a direct impact on individuals, organizations, and society as a whole. It is therefore necessary to understand human behavior, social dynamics, ethical issues, and psychological consequences in order to design more inclusive, accessible, and responsible systems. For example, in the fields of artificial intelligence, cybersecurity, and human-machine interfaces, a good understanding of social and cultural dimensions helps to anticipate uses, avoid biases, and strengthen user confidence. In short, combining technical skills with sensitivity to human realities promotes computer science that serves progress and the public interest.

### Objectives

This course, which takes place in S10 at the end of the engineering program, is intended to provide an in-depth approach to the interaction between the humanities, social sciences, and computer science. The objectives of this course are to study in depth several themes at the interface between digital technology and the humanities, social sciences, and economics.

## Presentation

### Description

This module aims to provide students with the advanced skills needed to design, deploy, administer, and secure modern IT infrastructures. It covers best practices and tools used to ensure system reliability, scalability, and security.

Topics covered include:

- Deployment automation
- System configuration and lifecycle management
- Service monitoring and observability
- Cybersecurity fundamentals applied to systems
- Vulnerability management and incident response
- Resilience and traceability challenges

## Objectives

- Design and deploy a reliable and scalable architecture, taking into account performance and environmental aspects.
- Identify, assess, and correct vulnerabilities in deployed systems, integrating security into all phases of a service's lifecycle.

## Teaching hours

Tutorials	Tutorials	33
-----------	-----------	----

## Mandatory prerequisites

Basic knowledge of systems, distributed systems, and networks.

## Presentation

### Description

This module follows on from the modules on big data and machine learning, in which the fundamentals of data science were presented through the various paradigms of machine learning and exploratory statistics. Their experiments using basic algorithms highlighted the limitations of basic modeling tools.

In this module, a set of advanced methods extending the fundamentals of learning is presented. Each approach improves the learning process by focusing on a particular aspect, such as reducing decision variance, handling nonlinear problems, or learning from a very large number of examples and automatic feature extraction. A conceptual presentation of the different methods will be accompanied by a discussion of their implementation and experimentation based on concrete cases of research and development.

Practical work will enable students to familiarize themselves with advanced learning libraries in Python and then use certain libraries to solve complex learning problems, such as Keras library for deep learning or the arulesSequences library for sequential pattern extraction. Reference data, such as the MNIST database (handwritten digits) or the CIFAR databases (objects and animals), will be used to train classification systems.

### Objectives

The course aims to:

- identify the conceptual and technological advances associated with the development of modern learning methods

- implement modern learning methods using appropriate development tools

---
